

Prescription

Diagnosis : Covid-19 positive

Symptoms : dry cough, headache, fatigue, fever 38.0

Treatment :

- Optimal supportive care includes oxygen for severely ill patients and those who are at risk for severe disease and more advanced respiratory support such as ventilation for patients who are critically ill.
- Dexamethasone is a corticosteroid that can help reduce the length of time on a ventilator and save lives of patients with severe and critical illness.

Note: Call your health care provider immediately if you have any of these danger signs: difficulty breathing, loss of speech or mobility, confusion or chest pain.
